It contrasts with: **atheism**, or denial of God's existence; **agnosticism**, or uncertainty; **deism**, or assertion that God is wholly outside the world, to which he bears only a causal relation; **theism**, or the doctrine that God transcends the world in his nature, though he may be omnipresent in it; and **polytheism**, or belief in more gods than one. Pantheism includes: **acosmism**, or the denial of a cosmos as a real existence or as other than an idealistic creation of the divine nature in which the world has its being; **cosmotheism**, or worship of the physical universe as the only divinity; **monism**, or the doctrine that there is but one organic being or all-inclusive reality; and also, certain forms of **mysticism** which assert the immanence of the divine nature, or the One. Historically, the chief pantheistic systems are: The **Stoic** system, which taught that God is the active physical force of the universe which periodically destroys and recreates itself; the **Neoplatonic** system, which embraces all forms of Neoplatonism that assert a One transcending all determinate or finite beings (a One above Reason, or Noûs) and deny true being to the world and men; the **Averroistic** system, the interpretation of Aristoteliansim by the Arabian Averroës, in which he affirmed the transcendent One, the form-giving principle, existing it above the world and above man, so that both man and natural beings perish at death and do not survive it (see AVERROISM); the **humanistic**, or **spiritualistic**, system, as the doctrine of Giordano Bruno, who conceived God as a world personality; the **Spinozistic** system, which taught that God is the universal substance in which reality exists attributively (see SPINOZISM); and the **Oriental**, or **Indian**, system, conceiving the universe as a deceitful appearance of the one absolute indeterminate or empty being. All these historical forms of pantheism have in common the doctrine of a general might which swallows up individual beings. For modern doctrines pantheistic or allied to pantheism, compare PANENTHEISM, PANLOGISM, PANPNEUMATISM, PANPSYCHISM, PANTELEOLOGISM, PANTHEISM.

2. A dramatic performance by actors using only, or chiefly, dumb show. The Roman *pantomime* was by masked actors, the mimicry being wholly bodily. The subjects were commonly well-known myths, but a chorus usually sang the story by way of interlude. In Italy the pantomime developed the characters of *Harlequin, Pantaloon, Columbine, Scaramouch* (which see), forming a kind of popular burlesque ; in France, in the 17th and 18th centuries, the name was applied to allegorical spectacles with characters from classical mythology ; in England a kind of folklore drama grew up with subjects largely from popular tales, of which dumb action as well as burlesque dialogue, music, and dancing by Clown, Harlequin, etc., are features. It has become a characteristic feature of the Christmas season.

pa'per (pā'pẽr), *n.* [F. *papier*, fr. L. *papyrus* papyrus, from which the Egyptians made a kind of paper, Gr. *πάπυρος*. Cf. PAPYRUS.] **1.** A substance made in the form of thin sheets or leaves from rags, straw, bark, wood, or other fibrous material, for various uses. The essential processes in the manufacture of paper are : the reduction of the raw material to a thin pulp ; the running of this pulp upon a flat sieve of fine mesh, which retains the fibers that become felted together ; and the removal and drying of the *felt* so formed. These processes are usually accompanied by others, according to the use for which the paper is designed, as bleaching, sizing, pressing or calendering, loading, tinting, etc. Machines for making paper in a continuous web were introduced about the year 1800, and most paper is now so made, though certain fine grades are still made by hand. In the **Fourdrinier machine** the sieve is a long endless wire cloth carried on rollers. A light cylinder, called the dandy roll, rests on the upper surface of the felt on the sieve, imparting the watermark and determining the character of the paper as *wove* (bearing the impression of a fine even gauze) or *laid* (marked with parallel lines). From this the felt passes on through rolls which express moisture, and over the driers, which are hollow cylinders heated with steam. A smooth surface is produced by calenders, and apparatus for sizing, etc., may also form a part of the machine. Where a high finish is required the paper is afterward passed through supercalenders. The cylinder machine differs from the Fourdrinier machine chiefly in having its sieve on a revolving cylinder, which dips into the vat of pulp. It is used principally in making heavy paper, board, and tissue paper. Paper consists of cellulose fibers in a more or less pure condition. It was made in early times from the inner bark of the paper mulberry by the Chinese, who extended the art to other materials and spread a knowledge of it among other nations. The best writing paper is made from linen rags. New paper is chiefly made from wood. Paper, when not sold in the roll, is furnished in various sizes (varying somewhat with different makers). The principal sizes are as follows :

Exchange is *in favor of* a place when the foreign money is there worth more than the par of exchange, and exchange will then be above par when the price is reckoned, as in London, in terms of a unit of domestic money, but below par when the price is reckoned, as in New York, in terms of a unit of the foreign money. Exchange is *against* a place when the foreign money is worth less there than the par of exchange. **2.** Equality of the nominal and market values of securities or certificates of value (often called **nominal,** or **face, par**), or of the value or price at which they are issued and their market value (called **issue par**). Thus if *par* for a course is 75, *bogey* is usually put down, arbitrarily, as 81 or 82.

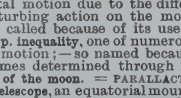
(neuter genitive plural) fr. παραλείπειν to omit.] A title given in the Vulgate and the Douay Bible to the Books of Chronicles. See OLD TESTAMENT. In the Septuagint these books are called Παραλειπομενων πρώτον (first) and Παραλειπομενων δεύτερον (second), which is understood, after Jerome's explanation, as meaning that they are supplementary to the Books of Kings.

par'al-lac'tic (păr'ă-lăk'tĭk) } *a.* [Gr. παραλλακτικός.]
par'al-lac'ti-cal (-tĭ-kăl) } Of, pertaining to, or due to, parallax. — **par'al-lac'ti-cal-ly**, *adv.*

parallactic angle, *Astron.*, the spherical angle at a heavenly body between its hour circle and the vertical circle passing through the body. — **p. equation**, *Astron.*, a minor inequality in the moon's orbital motion due to the difference between the sun's perturbing action on the moon when at new and full; — so called because of its use in finding the sun's parallax. — **p. inequality**, one of numerous irregularities in the moon's motion; — so named because the solar parallax is sometimes determined through its intervention. — **p. inequality of the moon.** = PARALLACTIC EQUATION. — **p. instrument** *or* **telescope**, an equatorial mounting, or an equatorial. *Obs.* — **p. libration of the moon.** See under LIBRATION. — **p. mounting** *or* **ladder**, an equatorial telescope mounting whose principal axis is directed toward the visible pole of the heavens. — **p. orbit**, the orbit in which a star appears to move round, once each year, owing to the earth's orbital motion round the sun.

par'al-lax (păr'ă-lăks), *n.* [Gr. παράλλαξις alternation, the mutual inclination of two lines forming an angle, fr. παραλλάσσειν to change a little, go aside, deviate; παρά beside, beyond + ἀλλάσσειν to change: cf. F. *parallaxe.*] The apparent displacement (or the difference in apparent direction) of an object, as seen from two different points; specif.,



Horizontal Parallax.
When the object (*B*) is on the horizon, the line to the observer (*O*) is tangent, and the Parallax (measured by *CBO*) is greatest.

Astron., the difference in direction of a heavenly body as seen from some point on the earth's surface (as *O* in the *Illust.*), and as seen from some other conventional point, as the center of the earth (*C*) or the sun. The word *parallax*, when not qualified, is generally understood to mean **diurnal**, or **geocentric, parallax**, or the parallax with reference to the earth's center. The **annual**, or **heliocentric, parallax** is that with reference to the sun, or the angle at the star subtended by lines drawn from it to earth and sun. Geocentric parallax is greatest when the body is on the horizon; and, since the earth is not spherical, this **horizontal parallax** is greatest when it is also equatorial, that is, when the point of observation is on the earth's equator.

parallax of the cross wires (of an optical instrument), their apparent displacement when the eye changes position, due to their being slightly out of the focus of the object glass.

par'al-lel (păr'ă-lĕl), *a.* [L. *parallelus*, fr. Gr. παράλληλος; παρά beside + ἀλλήλων of one another, fr. ἄλλος other, akin to L. *alius:* cf. F. *parallèle.* See ALIEN.] **1.** *Geom.* Lying evenly everywhere in the same direction, but never meeting, however far extended; in all parts equally distant; as, *parallel* lines; *parallel* planes.

☞ This is the Euclidean notion; in modern geometry such parallel lines (or planes) are thought as having only one point (or line) at infinity and that in common, and are said to meet at infinity, the whole infinitely remote region of the line (or plane) being thought as a point (or line), and of space as a plane, though for many purposes it is better conceived as a point. The justification for such conceptions lies in the fact that the whole of these infinite regions is transformed to a line or plane or point as the case may be, and conversely, by transformations, precisely defined, that turn only lines into lines, planes into planes, points into points, in all finite regions.

2. With like direction or tendency; running side by side; being in accordance (with); tending to the same result; like in essential parts; as, *parallel* passages.

When honor runs *parallel* with the laws of God and our country, it cannot be too much cherished. *Addison.*

parallel postulate. *Math.* The fifth of Euclid's postulates: "If a straight line incident on two straight lines make the angles within and on the same side less than two right angles, the two straight lines being produced indefinitely meet one another on whichever side the two angles are less than the two right angles." Persistent but vain attempts were made to remove this postulate, long felt to be a blemish on geometry. In 1829 Lobachévski substituted for it the following: "All straight lines (in a plane) that radiate from a given point may with respect to any other straight line in the plane be divided into two classes, intersectors and non-intersectors. A *boundary* line of the one class and the other is called *parallel* to the given line." Hence there would be two parallels, one on each side of the point (*P*), both making acute angles with the perpendicular (*p*) from the point to the line. On this basis he built up a geometry free from all possible internal contradiction. The Hungarian Johann Bolyai attained similar results (1823, published 1851). In 1854 Riemann in his inaugural dissertation "On the hypotheses that underlie geometry," published in 1867, showed that where the "measure of curvature" of a space is positive the space will be finite though unbounded (like a closed curve or surface); also, every two straight lines in the plane meet (in one point or in two, according as the space is *polar* or *antipolar* — *Klein*), thus setting aside Euclid's last "definition": "Parallels are straight (lines), which, being in the same plane and being produced indefinitely on both sides, meet each other on neither." In 1890 Sophus Lie showed that the Euclidean, Lobachevskian, and Riemannian are the only three-dimensional space forms in which figures may everywhere move freely in a sixfold infinity of ways. The four logical possibilities are shown in the *Illust.*

The term **paraphernalia bona** is used in the Roman law texts as an equivalent of *parapherna* (which see) ; and in most of the modern systems based upon the Roman law has much the same import. Improperly, the term was applied in the English common law to property which, while subject to the husband's control during his life (except the necessary articles of the paraphernalia), does not pass with his intestate estate and cannot be disposed of by testament by him, but is (excepting the necessaries) subject to his debts. No exact list of what are included in the paraphernalia can be made, the rules varying in different jurisdictions ; but, in general, the paraphernalia include such clothing, personal ornaments, etc., as are suitable to the woman in her station in life. In some States of the United States they are fixed in a general way by statute ; in others and in Great Britain the wife has been given separate property rights which make the term *paraphernalia* no longer applicable.

Syn.—PARAPHRASE, TRANSLATION, VERSION. A PARAPHRASE is a free and commonly amplified rendering of the sense of a passage, whether in the same or in a different language ; a TRANSLATION is a more or less close rendering from one language into another ; as, "*Paraphrase*, or *translation* with latitude, where [the author's] words are not so strictly followed as his sense ; and that too is admitted to be amplified" (*Dryden*) ; "You should have *translated*—that is, *paraphrased*, for, however far some people may err on this score, . . . a *translation* must be a *paraphrase* to be readable" (*E. FitzGerald*) ; "a comparison between the metrical *paraphrase* which we have of passages in the Old and New Testament, and these passages as they exist in our common *translation*" (*Wordsworth*). VERSION and *translation* are often used without distinction ; as, "Chapman's *translation* has often been praised as eminently Homeric. . . . Coleridge, in praising Chapman's *version*, says . . . 'It will give you small idea of Homer'" (*M. Arnold*) ; "The year 1632 saw a complete *version* of the 'Æneid' by Vicars, and a *translation* of the First Book by Sandys" (*J. Comington*). But *version* is the technical term for the ancient (and certain modern) translations of the Bible ; as, the Septuagint *Version ;* "Of *Versions*, or ancient *translations* of the whole or parts of the New Testament, . . . there are three principal classes, the Latin, the Syriac, and the Egyptian" (*Westcott and Hort*) ; the Authorized *Version*, the Revised *Version*, the Douay *Version.*

3. *Biol.* A plant or animal living in, on, or with, some other living organism (called its *host*) at whose expense it obtains its food, shelter, or some other advantage. Plant parasites are wholly or partially destitute of chlorophyll and draw the whole or a part of their organized nutriment from their host ; but there is no clear line of demarcation between parasites and saprophytes, and some fungi are capable of assuming either habit of life. The best examples of plant parasites are found among the pathogenic bacteria, the fungi infesting higher plants, and certain groups of seed plants, as the mistletoes, *Rafflesia*, etc. Among animals the term commonly designates those living on other animals, not on plants. Some are parasitic throughout life, many others only during certain stages ; a smaller number (as certain worms) live in different hosts during different stages of development. Some can move from one host to another or live independently if necessary ; others are completely dependent upon their hosts. Parasites may mostly be divided into external parasites (as fleas and lice), living upon, and internal parasites (as intestinal worms), living in, the body of the host. Some cause but little inconvenience to the host, but others are fatal to it. Parasitic animals generally exhibit a greater or less degree of degeneration of structure, esp. in their sense organs, locomotive organs, and often also in their digestive apparatus, consequent upon disuse of the parts, and many develop special organs for adhering to their host. Cf. INQUILINE, SYMBIOSIS, COMMENSAL, 2, SAPROPHYTE.

Hera promised him power, Athena glory, and Aphrodite the fairest woman in the world. See VICINITY; cf. PAROCHIAL.] **1.** Orig., in Great Britain and Ireland, and in some British colonies, the ecclesiastical unit of area consisting of the circuit or district committed to the charge of one parson or vicar or other minister having cure of souls therein, to whom its tithes and ecclesiastical dues are (or were originally) paid. Originally this district consisted of one or more vills or towns (in the southern portion of England usually one, in the northern portion usually several). The poor rate (first assessed in 1773) and later other rates were first assessed according to these ecclesiastical parishes as the units of division; later, upon the insistence of the vills or towns in northern England that they should be treated as units in the poor-law system, they became by force of statutes **civil parishes.** By this process (which began with 14 Car. II. c. 12, sec. 21) the civil parish (sometimes coincident with the ecclesiastical and sometimes not) became the important unit of local government, and a separation took place between the civil and ecclesiastical parishes (as in the definitions below). Many of the original parishes have been changed or subdivided by statute, so that now the term *parish* may designate: **a** An original parish (as noted above). **b** A **district parish** carved out of an older parish under the Church Building Act, 58 Geo. III. c. 45, and amendments thereof. **c** A **new parish,** or, as colloquially called, **Peel parish,** created under the New Parishes Acts of 1843, 1844, and 1856, and amendments thereof. **d** A **parochial chapelry** or **reputed parish,** which is a chapelry having the parochial rights of performing the rites of christening, burying, and churching, and differs from a parish proper essentially only in the want of a rectory and endowment. In Scotland an original parish that remains as such for all purposes is called a **par'ish quo'ad om'ni-a**; one that is created as an ecclesiastical parish, a **par'ish quo'ad sa'cra**: and a parish that is a civil parish only (see def. 2), a **par'ish quo'ad ci-vil'i-a** (sĭ-vĭl'ĭ-ă).

2. In Great Britain and Ireland and some British colonies, the subdivision of a county often coinciding with an original ecclesiastical parish (see def. 1), constituting the unit and most important district of local government. The parish is chiefly constituted for local revenue purposes, and the term may designate: **a** As originally (see def. 1), a **poor-law parish,** constituted for the collection of the poor rate and the administration of the poor law. This division is defined by Act 52 & 53 Vict. c. 63, § 5, as "a place for which a separate poor rate is or can be made, or for which a separate overseer can be appointed." The administrative body of the district is the **parish council** or **meeting. b** A district separately assessed for the land tax, and called a **land-tax parish. c** A district made a unit for the maintenance of highways, and called a **highway parish. d** A district treated as a parish for the purpose of the Burial Acts (beginning with 15 & 16 Vict. c. 85, 1852), and called a **Burial Acts parish.**

Syn. — PART, PORTION, PIECE, FRAGMENT, SECTION, SEGMENT, DIVISION. PART, the general term, denotes simply that which is, or is regarded as being, a constituent or fraction of a whole; a PORTION is a part regarded as more or less independent, or (esp.) as assigned or allotted to some particular individual, function, or purpose; as, "Divide a minute into a thousand *parts*" (*Shak.*); "All are but *parts* of one stupendous whole" (*Pope*); "the hinder *part* of the ship" (*Mark* iv. 38); "The priests had a *portion* assigned them" (*Gen.* xlvii. 22); "Father, give me the *portion* of goods that falleth to me" (*Luke* xv. 12); "Art, thus conceived, realizes for men a larger *portion* of life" (*Stevenson*); "In the lowest organization all *parts* are competent to perform all functions, and one hand the same *portion* of protoplasm may successively take on the function of feeding, moving, or reproducing apparatus" (*Huxley*). A PIECE is a detached part or portion, often of a vaguely defined whole; it is frequently regarded as relatively complete in itself; a FRAGMENT is a broken or imperfect part, commonly of a more definite whole; as, a *piece* of paper, of chalk, of string, of cloth, a *piece* of bread, a *piece* of money, a *piece* of poetry, of music, of. to break in *pieces*; a *fragment* of pottery (cf. a *piece* of pottery), a *fragment* of an antique statue; "They took up of the *fragments* . . . twelve baskets full" (*Matt.* xiv. 20); "I considered the *fragment* of "Hyperion" as second to nothing that was ever produced by a writer of the same years" (*Shelley*). A SECTION is a distinct part, esp. of a writing, of a body of people, or of a country or region, a SEGMENT is esp. a part cut off by natural lines of cleavage or division (for technical senses, see defs.); as, a *section* of a chapter, the advanced *section* of the clergy, the east or *section* of the country; a *segment* of an orange, a *segment* of a leaf. DIVISION is more general than *section* or *segment*; as, "People say that the whole human frame in all its parts and *divisions* is gradually in the act of decaying and renewing" (*Scott*). See DIVIDE, COMPONENT, PARTAKE.

The customary division of the *parts of speech* in the Indo-European language, as handed down from the grammarians of antiquity, rests upon no systematic application of logical principles. . . . It . . . has been effected by the consideration of three points: the meaning of a word, taken by itself, its function in the sentence, and its behavior in regard to inflection and word formation. *H. Paul* (*trans.*).

Syn. — PARTAKE, PARTICIPATE, SHARE. To PARTICIPATE is esp. to take part (with others) in something, seldom with reference to material things; as, to *participate* in a conversation, to *participate* in another's feelings. SHARE emphasizes strongly the idea of community of possession, enjoyment, endurance, etc., whether with reference to material or immaterial things; as, "Among the lines . . . is this — 'Unmeet for Solitude to *share*.' Now to *share* implies more than one, and Solitude is a single gentleman" (*Byron*); "The confidential talk he could not always *share*" (*W. Pater*). See PART.

Several, as *P. hysterophorus*, the bastard feverfew, and *P. integrifolium*, are used medicinally.

par'the-no- (pär'thē-nō-). A combining form from Greek παρθένος *virgin, maiden*, used chiefly in biological terms to signify *pertaining to reproduction without fertilization*.

par'the-no-gen'e-sis (-jĕn'ē-sĭs), *n.* [*partheno-* + *-genesis.*] **1.** *Zoöl.* Reproduction by virgin females by means of eggs which develop without being fertilized by spermatozoa. It occurs chiefly in certain insects, crustaceans, and worms, the most familiar example being that of the aphids, in which a number of parthenogenetically produced generations, consisting entirely of females, follow the sexually produced one. Finally males are produced (also by parthenogenesis) and sexual reproduction again takes place. Parthenogenesis is a modification of sexual reproduction sharply distinguished from asexual reproduction, as the young develop from true eggs, not from buds or parts of the body. It must also be distinguished from the fertilization of the eggs of a hermaphrodite animal by its own spermatozoa. In some cases incomplete maturation (which see) has been observed in parthenogenetic eggs, and the nuclear material thus retained may take the place of that ordinarily derived from the male. An *artificial parthenogenesis*, or development without fertilization up to a certain stage, has been produced in the eggs of some animals by chemical reagents.

2. *Bot.* The form of apogamy in which an embryo develops from an unfertilized egg. It is of frequent occurrence among certain algæ and fungi, while in one family of molds (Saprolegniaceæ) it is the rule rather than the exception. Parthenogenesis is rare among seed plants, but has been demonstrated in *Antennaria* and a few other genera; in these it is probably an instance of reversion to an ancestral isogamous condition. See APOGAMY, 2 **b**.

par'the-no-ge-net'ic (pär'thē-nō-jē-nĕt'ĭk), *a. Biol.* Pertaining to, or produced by, parthenogenesis. — **par'the-no-ge-net'i-cal-ly** (-ĭ-kăl-ĭ), *adv.*

Par'the-non (pär'thē-nŏn), *n.* [L., fr. Gr. Παρθενών, fr. παρθένος a virgin, i. e., the goddess Athena.] A celebrated Doric temple of Athena, on the Acropolis at Athens. It is of Pentelic marble; in design, octastyle peripteral, with 17 columns on the sides; dimensions, 228 × 101 × 65 feet. The Parthenon was in both plan and finish the most consummate building in the Doric style, exhibiting refinements of line that have never been surpassed. It was the work of Ictinus, was begun about B. C. 447, and by 438 was ready for the great gold and ivory statue of Athena by Phidias, who also probably designed the decorative sculptures, which consisted of: (1) Colossal sculptures in the round, filling the two pediments, the eastern group thought to have represented the birth of Athena, the western, her contest with Poseidon for Attica. (2) 92 metopes in high relief, showing, on the east, the struggle between the gods and the giants; on the west, that between the centaurs and Lapithæ; and on the north and south, subjects which have not been made out. (3) The long frieze in low relief around the entire cella wall without is often asserted to represent the great Panathenaic procession. In both construction and sculptures the Parthenon was the most perfect product of Athenian art at its best period. In 1687 it was shattered by an explosion, and about 1811 its sculptures were largely removed to Lord Elgin. See ELGIN MARBLES.

Par-then'o-pe (pär-thĕn'ō-pē), *n.* [L., the name of a Siren, fr. Gr. Παρθενόπη.] **1.** *Gr. Myth.* One of the Sirens, who threw herself into the sea because unable to beguile Odysseus by her songs. 4. *Law.* The relation existing between two or more competent persons who have contracted to place their money, effects, labor, and skill, or some or all of them, in lawful commerce or business with the understanding that there shall be a communion of profit between them; a copartnership. This, which is essentially Judge Story's definition, has been the most widely accepted definition in the United States. The term is now defined in various codes in the United States, as typically in New York and California. The New York code defines partnership to be, "as between the members thereof, the association, not incorporated, of two or more persons who have agreed to combine their labor, property, and skill, or some of them, for the purpose of engaging in any lawful trade or business, and sharing the profits and losses, as such, between them" (*Gen. Laws*, chap. 420, of 1897). The definition of the California code is: "*Partnership* is the association of two or more persons for the purpose of carrying on business together and dividing its profits between them" (*Civil Code* § 2395). In Great Britain the Partnership Act of 1890 defines a partnership as "the relation which subsists between persons carrying on a business in common with a view of profit," where "business" includes every trade, occupation, or profession. The act excepts from inclusion under this many corporations and companies, such as joint-stock companies, cost-book mining companies, and others, which differ from ordinary partnerships in many important respects, which would otherwise be included under it. At the common law the members of a partnership may restrict their liabilities and rights among themselves as they see fit; but such restrictions are not binding upon innocent third parties without notice. Also, in a common-law partnership, which is called a **general partnership**, each partner has a general liability for all partnership debts in full; but statutes now generally provide for the formation of **limited partnerships** in which one or more of the members (but not all) may have only a limited liability (usually to the amount of the capital contributed), but any material failure to conform to the terms of the statute creates a general liability. Where the partnership is formed for the transaction of a particular enterprise only, it is called a **particular,** or **special, partnership**. In the Civil Law systems, limited-liability partnerships may be formed by agreement between the partners, as in case of the commandite or of dormant partners (see PARTNER, 3).

patristic philosophy, the philosophy developed by the Fathers of the Christian church. *Patristic philosophy* is commonly divided with reference to the Council of Nice, A. D. 325, into antenicene and postnicene. The *antenicene* was the period of the rise and development of Christian philosophy in presence of the opposition of pagan philosophy and Gnosticism. In the earliest period it took the form of apologies, or defenses, of the Christian faith. In the *African school*, of which Tertullian and Arnobius were chief representatives, these were aimed to discredit pagan thought and to exalt Christian faith above the need of reason. In the *Alexandrian school*, taking its rise from Justin and Athenagoras and including Clement and Origen, there was an attempt to show the best of pagan thought to be in accordance with Christianity. The *postnicene* period, including among others Athanasius, Hilary, Basil, Gregory of Nyssa, and Cyril of Alexandria, culminates in St. Augustine. His formulation of Platonic and Neoplatonic conceptions in subordination to Christian dogma paved the way for the later and fuller development of Christian philosophy by the Schoolmen, who, in a measure, adjusted the conflicting claims of faith and reason. In higher forms the cartilage becomes ossified and divided into distinct elements (the scapula above, the procoracoid and coracoid below) and complicated by the addition or substitution of one or more membrane bones. In man the scapula alone of the original elements is well developed, the coracoid being represented only by a process, and the precoracoid replaced by the clavicle, which connects the scapula with the sternum, and is the only bony connection of the arm bones with the rest of the skeleton. Even this connection is wanting in many quadrupeds, the clavicle having disappeared. Etymologically and in general use there is no distinction between *peddler* and *hawker*; but technically, in England, a distinction is made by statutory definition, which uses *hawker* for one who goes about with a beast or burden or other means of artificial carriage, and restricts *peddler* to one who travels on foot, defining *peddler* as: one who "without any horse or other beast bearing or drawing burden, travels and trades on foot and goes from town to town or to other men's houses, carrying to sell, or exposing for sale, any goods, wares, or merchandise immediately to be delivered, or selling or offering for sale his skill in handicraft." (24 & 25 *Vict.* c. 96.) In the United States *peddler* and *hawker* are used as synonymous in statutes regulating the vending of goods. A *peddler* or *hawker* is distinguished from a canvasser, drummer, or solicitor, in that the latter do not carry about their goods and sell and deliver them, but merely take orders for another who afterwards delivers them, whether by the one who took the order or otherwise. So also a *peddler* is distinguished from a person, as a farmer, who, having a fixed place of business, sells the product of his business from house to house.

Pe'li-as (pē'lĭ-ăs ; pēl'ĭ-), *n.* [L., fr. Gr. Πελιας.] *Gr. Myth.* A king of Iolcus. He sent Jason after the Golden Fleece, and after Jason's return was cut to pieces and boiled by his own daughters, who had been told by Medea that thus they might restore him to youth. His son Acastus drove Jason and Medea out of the country. See JASON, 1, MEDEA.

pel'i-can (pĕl'ĭ-kăn), *n.* Also *pelecan.* [F. *pélican,* L. *pelicanus, pelecanus,* Gr. πελεκάν a water bird of the pelican kind ; cf. πελεκᾶς woodpecker, πελεκᾶν to hew with an ax, πέλεκυς an ax, Skr. *paraçu.*] **1.** Any of certain very large totipalmate birds of the genus *Pelecanus,* with a very large bill and distensible gular pouch in which the food (fish) is carried, and very long wings. About ten species are known. The American white pelican (*P. erythrorhynchos*), now found chiefly in western North America, is pure white with black primaries, about five feet long, and its wings spread nearly twelve feet. Several somewhat similar species occur in the Old World, two (*P. onocrotalus* and *P. crispus*) in southeastern Europe. The brown pelican (*P. occidentalis*), common in Florida, is chiefly dark brown and silvery gray. A similar species (*P. californicus*) occurs on the Pacific coast. The spectacled pelican (*P. conspicillatus*) inhabits Australia and New Guinea. It was formerly erroneously believed that pelicans fed their young with their own blood ; hence the pelican is often depicted in heraldry and symbolic art in her piety, that is, over her nest, with wings extended, and wounding her breast, from which fall drops of blood. This fabled practice of the bird became symbolic of Christ, and of charity.

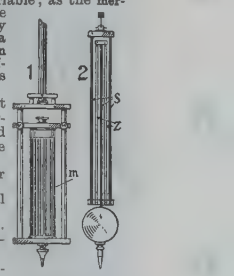
In the vertebrates above the fishes it commouly consists of three more or less completely united elements on each side, a dorsal, the *ilium*, and two ventral, the *pubis* and *ischium*. In man these elements are consolidated into the *innominate bone*. A fourth small element, the *cotyloid*, occurs in some animals. In elasmobranchs the pelvic girdle is represented by a single cartilage. In teleosts it is wanting, and the pelvic fins are supported only by an enlarged basipterygium embedded in muscle. Cf. PELVIS, PECTORAL ARCH. — **p. cavity.** *Anat.* See ABDOMEN, 1. — **p. fascia,** *Anat.*, a membrane lining the cavity of the pelvis. [L., a basin, laver.] **1.** *a Anat. & Zoöl.* The basinlike structure in the skeleton of many vertebrates formed by the pelvic arch together with the sacrum and often certain coccygeal and caudal vertebræ. In man it is composed of the two innominate bones, which bound it on each side and in front, and the sacrum and coccyx, which complete it behind. Its cavity is divided by an imaginary plane passing from the top of the pubic symphysis, through the iliopectineal line, to the top of the sacrum, into the *false pelvis* above and the *true pelvis* below. In most land mammals the pelvis is somewhat like that of man. In birds it is very large, the iliac portion (see ILIUM) being greatly prolonged and consolidated with many vertebræ. In other vertebrates it may be wanting or variously reduced, forming no distinct cavity; the term then simply designates the bones of the pelvic arch collectively. **b** *Anat. & Med.* The cavity of the pelvis, divided into two parts, *true* and *false*. pen'du-lum (-lŭm), *n.*; *pl.* -LUMS (-lŭmz). [NL., fr. L. *pendulus* hanging, swinging. See PENDULOUS.] **1.** A body so suspended from a fixed point as to swing freely to and fro under the combined action of gravity and momentum. It is used to regulate the movements of clockwork and other machinery; — called specif. **gravity pendulum.** The **simple,** or **mathematical, pendulum** is purely theoretical, consisting of a particle, or material point, suspended by a thread without weight and oscillating without friction. Any other pendulum is a **compound,** or **physical, pendulum,** whose length is the distance between the axis of suspension and the axis of oscillation. If the arc of vibration be small enough, the time of oscillation depends practically not on its amplitude of vibration, but only on the length of the pendulum. The length of a **seconds pendulum,** i. e., one requiring one second to move from extreme to extreme, is 39.1398 in. in the latitude of Greenwich, 39.0968 in. in that of Washington. Obviously, accurate clocks must have pendulums of practically constant length. This need is met by the **compensation pendulum,** in which the effect of changes of temperature on the length of the rod is so counteracted, usually by the opposite expansion of different metals, that the distance of the center of oscillation from the center of suspension remains invariable; as the **mercurial compensation pendulum,** in which the expansion of the rod is compensated by the opposite expansion of mercury in a jar constituting the bob, and the **gridiron pendulum,** in which compensation is effected by the opposite expansion of sets of rods of different metals.



1 Mercurial Pendulum. *m* Glass Jar of Mercury. 2 Gridiron Pendulum. *s* Steel Rods; *z* Zinc Rods

S. It is legal tender up to twelve pence. Abbr., *d.* (initial of *denarius*). Originally, the penny was of silver. It was the chief Anglo-Saxon coin, and corresponded to the *denarius* of the Continent. It was gradually reduced in weight from over 22 grains to 10, and debased. Since the 18th century it has been made of copper or (since 1860) of bronze, except a small number issued in silver as maundy money.

POPULACE, PUEBLO.] **1.** A body of persons united by a common character, culture, or sentiment; the individuals collectively of any characteristic group, taken as distinct from, or conceived apart from, the unity of the group as subject to a common government (that is, as a *nation*) or as issued from a common stock (that is, as a *race* or *tribe*); a folk. Sociologically, the traits which characterize a *people* are community of custom, belief, and tradition (generally, also, of language and geographical position), and a feeling of mutual familiarity taking the form of a sentiment of solidarity or a "consciousness of kind." Most *peoples* are made up of minglings of *races*, as is the American people. A *nation* may comprise one or more *peoples*; as, the Austrian *nation* comprises both Germanic and Slavonic *peoples*; or it may be comprised in a *people*; as, the ancient Greek *people* formed many *nations*. Cf. def. 2, also NATION, RACE.

The Basques . . . contain two radically distinct physical types. . . . They are a *people* and not a race. *W. Z. Ripley.*

People is a still more elastic expression, and may be taken to comprise in the singular all the uncombined sections of the nation, in the plural an aggregate of nations remotely connected by vague traditions, allied languages, and especially a common social culture. *A. H. Keane.*

2. A race, tribe, or nation; — used without emphatic reference to consanguinity or nationality; as, the *peoples* of Europe; the Caucasian is the world's dominant *people*. **3.** The persons of a particular group, taken distributively; as: **a** The members of a community geographically distinct; as, the *people* of London; the *people* of Ceylon (cf. POPULATION); — often used in partial reference to def. 1; as, the plains *people*. **b** The members of a class; as, the better *people* of the community. **c** The members of an organization, as of a congregation or society; as, the *people* of the North Church. **d** Persons distinguished by occupation or interest; as, literary *people*; trade*people*. **e** The persons under a superior, as the subjects of a monarch, a body of retainers, servants, etc.; — usually with the possessive. "You slew great number of his *people*." *Shak.* **f** Members of one's family or kindred; relatives; often, ancestry; as, my *people* were English. *Colloq.* **4.** The mass of a community as distinguished from a special class; the commonalty; the populace; the vulgar; the common crowd; as, nobles and *people*. **5.** The body of enfranchised citizens of a state; the electorate; in a broader sense, the body of persons in whom is vested the sovereignty of a nation or who are capable of expressing their general wish, as by public sentiment. **6.** a Human beings, as distinguished from animals. **b** Living creatures; often, specif., animals of a certain kind or habit; as, the bee *people*; the forest *people*; also, supernatural beings; as, the "little *people*," that is, fairies.

7. Persons; folks; — used as an indefinite subject of a verb, like *on* in French, and *man* in German; as, *people* in adversity; *people* who like gayety.

People were tempted to lend by great premiums. *Swift.*

☞ *People* is regularly construed as a plural except in senses 1 and 2, in corresponding applications of 6 **b**, and (formerly) in an indefinite or general sense of def. 3 (equivalent to "group" or "multitude of people"), as in, "The palace full of *peoples* up and down" (*Chaucer*). In these excepted senses it is construed as a collective singular, and may take the plural *peoples*, as:

A blissful life, a paisible [peaceable] and a sweet,
Ledden [led] the *peoples* in the former age. *Chaucer.*

This plural was, however, largely avoided from the 16th to the early 19th century, *people* being used both as singular and plural. Hence, in some early versions of the Bible, Hebrew and Greek plurals were translated by *people* where the Revised Version substitutes *peoples*, thus:

We . . . have taken strange wives of the *people* of the land. *Ezra* x. 2 (*King James Ver.*).
We . . . have married strange women of the *peoples* of the land. (*Rev. Ver.*)

Occasionally, when used collectively, *people* is construed as a plural, as:

Every *people* worthy of being called a nation possess . . . ample resources for expressing the highest ideas. *Buckle.*

Syn. — PEOPLE, NATION, RACE. PEOPLE, as here compared, suggests the whole community regarded as an aggregate of individuals, yet as constituting a unit; NATION emphasizes less the mass of individuals, more the political, institutional, or territorial unity; RACE lays stress on the idea of common origin or descent; more technical distinctions, see defs.: as, "We here highly resolve that . . . this *nation*, under God, shall have a new birth of freedom, — and that government of the *people* by the *people* and for the *people* shall not perish from the earth" (*A. Lincoln*); "A State is accidental; it can be made or unmade; but a *nation* is something real which can be neither made nor destroyed" (*J. R. Green*); "the crashing defeat of the Celtic *race* in Britain" (*M. Arnold*). See POPULACE.

per-cep'tion (-shŭn), *n.* [L. *perceptio*: cf. F. *perception*. See PERCEIVE.] **1.** Mental apprehension or cognition, whether of objects of sense or of ideas; sensible experience or thought which involves recognition of truth or of fact. This original broad meaning is now rare in psychology, *perception* being commonly restricted to sense perception (def. 2) or to forms of cognition analogous to it in immediacy (def. 8).
The word *perception* is, in the language of philosophers previous to Reid, used in a very extensive signification. By Descartes, Malebranche, Locke, Leibnitz, and others, it is employed in a sense almost as unexclusive as consciousness, in its widest signification. By Reid this word was limited to our faculty acquisitive of knowledge, and to that branch of this faculty whereby, through the senses, we obtain a knowledge of the external world. But his limitation did not stop here. In the act of external perception he distinguished two elements, to which he gave the names of *perception* and sensation. He ought perhaps to have called these *perception* proper and sensation proper, when employed in his special meaning. *Sir W. Hamilton*

Cognition or apprehension occasioned by and involving the presence of sensation in consciousness; direct apprehension of an object of sense; specif.: **a** The power or function of having such cognition. **b** The cognitive act or process. **c** The object of sensible cognition as it appears in consciousness; a percept. For the psychological distinction of *perception* and *conception*, see CONCEPTION, 4 **c**. Cf. also APPREHENSION, COGNITION, 3, INTUITION, 2, SENSATION. The distinction between *perception* and *percept* is analogous to that between *conception* and *concept*. See CONCEPTION, 3 & 4, CONCEPT, 2 **c**, *cits.*; cf. RECEPT, IDEA, 5, IMPRESSION, 5.
3. An immediate or intuitive cognition or judgment; an insight analogous to sense perception in respect of immediacy and the feeling of certainty accompanying it, and often implying nice observation or subtle discrimination; as, a *perception* of mathematical truth or of logical sequence. Also, the power or faculty of having or exercising such perceptions; as, moral *perception*; keen æsthetic *perception*.
The *perception* of distance by the eye, which seems so like intuition, is thus, in reality, an inference grounded on experience. *J. S. Mill*
Perception is a wide word, including, as frequently used, any so-called immediate apprehension; even that, for instance, by which we are supposed to see the necessary truth of one of Euclid's axioms. *B. Bosanquet.*

Such groups are called **triads of Döbereiner.** In 1864 Newlands and Lothar Meyer independently arranged a number of the elements in order of their atomic weights so as to bring out the fact that at the end of a certain *period* the same properties recur. This **periodic system** of classification of the elements was brought to its present position of prominence chiefly by Mendelyeev, who in 1869–70 not only discussed in detail the relations of the known elements, but,

PERIODIC SYSTEM OF THE CHEMICAL ELEMENTS.

Atomic weights are in round numbers. The horizontal rows represent periods; the columns, "natural families" or groups. Roman numerals denote the highest valence (in some cases theoretical) toward oxygen; the *italics*, valence toward hydrogen. In columns 0–VII, elements whose symbols are in the same vertical line are more closely related to one another than to the other elements of their family. Column VIII contains three groups, the members of each of which have similar properties and nearly the same atomic weights. Gaps (indicated by dashes) may be filled, as often in the past, by discovery of new elements.

Per'mi-an, *n.* **1.** *Geol.* The Permian period, system, or formation. The rocks consist largely of red sandstone and shale, much of the sediment being of nonmarine origin. The Permian was a period of notable geographic changes. Land areas were enlarged and mountains formed. The climate seems to have been somewhat generally arid, and at some times and places cold. Life was reduced in amount, especially on land, and changed in kind. The amphibians began to decline by the close of the period, and primitive reptiles appeared. The most remarkable event of the period was extensive glaciation in India, South Africa, South America, and Australia.

*For dates occurring in Jan. or Feb. of leap year, use *italic* names of months, above.

To find the day of the week corresponding to any date, find the small letter directly under the month and opposite the day of the month; the same small letter also appears in the vertical column that contains the number of the year; and if the line in which it stands is followed out to the right, the day of the week is found. Thus, the small letter under March and opposite 18 is *b*; *b* appears again directly over 1904, and at its right is the word *Friday*. March 18 fell on Friday in 1904, and also in 1898, 1892, etc. The calendar has other uses, as for finding the months which begin on Sunday in a particular year, etc.

This is the sense of this term in the civil law systems. **b** In the common law, any action not brought for the recovery of, or involving rights in, lands, tenements, or hereditaments; that is, one brought to enforce or recover a debt or personal duty, or damages in lieu of it, or damages for an injury to person or property, or for the specific recovery of, or enforcement of a lien upon, goods or chattels. — **p. allegiance.** See ALLEGIANCE, 2. — **p. effects,** effects of a personal character; esp., as used in wills, tariff laws, etc., such property especially appertaining to one's person. The effect of this distinction has been to cause certain rights attached to land to be classed as personal which were originally considered as real. Cf. 3. Art or science of representing, on a plane or curved surface, natural objects as they actually appear to the eye.

The **aërial perspective** of painters is the expression of space by gradations of color, distinctness, etc., while **linear perspective,** or simply **perspective,** is a branch of applied geometry and deals with the apparent directions and dimensions of objects as seen from a certain point, called the **station point** (*SP* in *Illust.*). It is

sometimes called **conic,** or **conical projection,** because all the rays of light which enter the eye from the objects viewed may be considered as forming a cone of which the eye is the vertex. When a correctly drawn picture of the scene is interposed at the proper place in this cone, each point in it will appear to coincide with the corresponding point of the scene. The picture, if plane, is then in what is called the **picture plane, plane of delineation,** or **perspective plane.** The **direct radial** (*DR*), **line of direction, line of sight,** or **principal visual ray** is the perpendicular from the station point to this plane, which it intersects in a point called the **center of vision** (*CV*), or **principal point.** The **principal distance** is the length of this perpendicular. The term **point of sight** is applied by some to the station point, by others to the center of vision. The **ground line** is the base line of the picture; the **horizontal line,** or **horizon,** passes horizontally through the center of vision. All **original lines** (that is, lines of the natural objects) parallel to the direct radial appear to the eye, as they recede from it indefinitely, to meet at the center of vision. The latter is hence called their **vanishing point.** The vanishing point of a group of lines that are parallel neither to the direct radial nor to the horizontal line is called an **accidental point;** it is further distinguished as **aërial** or **terrestrial,** according as it is above or below the horizontal line. A **point of distance** (*DP*) is one used in measuring off the apparent distances of points from each other or from the ground line.

The simplest form of linear perspective is **parallel,** or **one-point, perspective,** in which the principal lines of the picture are either parallel or perpendicular to the picture plane. In **angular,** or **two-point, perspective** some of these lines are oblique and some are not, while in **oblique,** or **three-point, perspective,** all the principal lines are oblique. These three cases are illustrated by a cube having respectively a face, an edge, and a corner presented to the observer. **Diagonal perspective** is merely that case of angular perspective in which the oblique lines make an angle of 45° with the picture plane.

Although linear perspective is ordinarily **plane,** it may be **curvilinear.** Of the possible kinds of curvilinear perspective the only one used in practice is **cylindrical,** or **panoramic, perspective,** in which the picture is made upon a concave cylindrical surface, as in a panorama. **Spherical perspective,** in which a spherical surface is used, possesses rather too many practical difficulties to be available. **Architectural perspective** is linear perspective applied to architectural drawings. **Bird's-eye perspective** is a representation, by any of the above methods, of objects seen from a great height.

4. The apparent relative distance of objects to the eye, as indicated by their relative size, distinctness, and the convergence of their receding lines.

per'spi-ra'tion (pûr'spĭ-rā'shŭn), *n.* [Cf. F. *perspiration*.]

1. Act or process of perspiring.

2. The saline fluid secreted by minute tubular glands, the sweat glands, which are present in greater or less abundance all over the surface of the human body; sweat. Perspiration, which consists chiefly of water, contains sodium chloride, nitrogenous substances (including urea), carbon dioxide, etc. Its amount is very variable, increasing with the temperature, muscular exertion, and other factors, but as excretory channels the sweat glands are, in man, of minor importance, the chief function of perspiration being to regulate the temperature of the body by the cooling effect of its evaporation. A small and variable amount of such secretion and evaporation (called *insensible perspiration*) goes on constantly. In some mammals, as dogs, there is little perspiration, and its functions are in part performed by increased evaporation from the lungs.

Syn. — PERSPIRATION, SWEAT. PERSPIRATION, the Latin word, is common in physiological use, esp. as denoting the act or process of excretion; the word has also gained wide currency in polite usage; SWEAT, the Saxon word, is stronger and more direct; as, "Placing the patient between blankets materially promotes *perspiration*" (*Napheys*); "My custom is to undress and sit on the rocks, reading Herodotus, until the *perspiration* has subsided, and then to leap from the edge of the rock into [the] fountain" (*Shelley*); "In the *sweat* of thy face shalt thou eat bread" (*Gen.* iii. 19); "By thine Agony and Bloody *Sweat*" (*Bk. of Com. Prayer*); "*sweat* and effort, human nature strained to its uttermost and on the rack, yet getting through alive" (*W. James*). The recent tendency to regard the word *sweat* as indelicate is extreme, and often wholly without warrant; thus, "There are certain cases . . . where the vulgar Saxon word is refined, and the refined Latin word vulgar, in poetry — as in *sweat* and *perspiration*" (*Lowell*). Except in technical usage, *sweat*, not *perspiration*, is used of the lower animals.

pe-trog'ra-phy (pē-trŏg'rə-fĭ), *n.* [*petro-* + *-graphy.*] The description and systematic classification of rocks (see PETROLOGY). Of the various systems of classification of rocks none has yet been generally accepted. In 1903 four American petrographers published a new system for igneous rocks with a new nomenclature and called "Quantitative Classification of Igneous Rocks." In this system the rocks are classified primarily with reference to their quantitative chemical composition, as determined by chemical analysis or often by optical examination. A few minerals (**standard minerals**), which together contain all the ordinary elements of rocks, have been selected, and the chemical composition of the rock is calculated in terms of these minerals. Each rock is classified according to this theoretical mineral composition, called the **norm**, whether it is the same as the actual mineral composition (called the **mode**) or not. The standard minerals are divided into two groups, *salic* and *femic* (see defs. below). According to the proportion of salic to femic minerals which it contains, any rock falls into one of five classes: (1) **persalane** — ratio of salic to femic greater than $^7/_1$; (2) **dosalane** — dominantly salic, ratio between $^7/_1$ and $^5/_3$; (3) **salfemane** — ratio between $^5/_3$ and $^3/_5$; (4) **dofemane** — dominantly femic, ratio $^3/_5$ to $^7/_1$; (5) **perfemane** — extremely femic, ratio greater than $^7/_1$. These five classes (ending, **-ane**) are divided on similar principles into **orders** (ending, **-are**), the orders into **rangs** (ending, **-ase**), and the rangs into **grads** (ending, **-ate**). There are also subclasses (**-one**), suborders (**-ore**), subrangs (**-ose**), and subgrads (**-ote**). Orders are named after countries; their subdivisions, after typical localities.
The outline below shows the chief divisions and subdivisions of the system, so far as named. For meanings of the adjectives used, consult the glossary below. In classes I, II, and III, rang **1** is *peralkalic*; rang **2**, *domalkalic*; rang **3**, *alkalicalcic*; rang **4**, *docalcic*; and rang **5**, *percalcic.*

pet'ro-la'tum (pĕt'rō-lā'tŭm), *n.* [NL. Cf. PETROL, PETROLEUM.] *Pharm.* A neutral unctuous substance, without taste or odor, derived from petroleum by distilling off the lighter portions and purifying the residue. It is used as a bland protective dressing, and as a substitute for fatty materials in ointments. Three forms are recognized: *liquid*, a colorless or yellowish oil; *soft*, a white or yellowish semisolid substance; *hard*, a white or yellowish waxlike mass. All are more or less fluorescent when yellowish. When the form is not specified soft petrolatum is understood. *Petrolatum* is the official name for the purified product. *Cosmoline* and *vaseline* are commercial names for substances essentially the same as soft petrolatum, but differing slightly in appearance and consistency or fusibility. An "artificial vaseline" is made in Europe by dissolving paraffin in mineral oil, but it is less homogeneous than the true petrolatum.

pe-tro'le-um (-ŭm), *n.* [LL.; L. *petra* a rock + *oleum* oil: cf. F. *pétrole.* Cf. PETRIFY; OIL.] Rock oil, mineral oil, or natural oil, a dark brown or greenish inflammable liquid, which at certain points exists in the upper strata of the earth, whence it is pumped, or forced by pressure of the gas attending it. It is found in many localities, the most celebrated of which are Pennsylvania and Baku. Petroleum consists of a complex mixture of various hydrocarbons, and varies much in appearance, composition, and properties. There has been much discussion as to its origin; it appears to be due to a variety of causes, according to conditions. Petroleum is refined by fractional distillation, yielding successively volatile products, kerosene, lubricating oils, and paraffin. See KEROSENE, etc. The table below gives a list of the best-known volatile products from American petroleum, in order of volatility. Cymogene is gaseous except at low temperatures; the others are liquids. Since these products are mixtures, there are no rigid boundaries between them; the figures indicate only their general range. According to some, *petroleum ether* includes both rhigolene and gasoline.

PRODUCT.	SP. GR.	BOILING POINT.	USES.
Cymogene	0.38 (10° B.)	0° C. (32° F.)	Refrigerant.
Rhigolene	0.60 (100° B.)	18° C. (65° F.)	Anæsthetic.
Petroleum ether	.65-.66 (81°-82° B.)	40°-70° C.	Solvent; carburetant.
Gasoline	.66-.69 (82°-73° B.)	70°-90° C.	Solvent; fuel; illuminant.

phe-nom'e-non (fē-nŏm'ē-nŏn), *n.*; *pl.* -ENA (-nă). [L. *phaenomenon*, Gr. φαινόμενον, neut. p. pr. of φαίνεσθαι to appear, φαίνειν to show. See PHANTOM.] **1.** Any observable fact or event; as: **a** In the broadest sense, any fact or event whatever; any item of experience or reality. **b** In the original (Greek) usage, a fact or event in the changing and perceptible forms, as distinguished from the permanent essences of things. There was a double but related antithesis in the ancient conception, *phenomena* being the mutable, caused, or developing aspects of things as opposed to their fixed and substantial natures, and also their perceptible aspects or appearances as opposed to their true or ideal being. The **phenomenal world** was thus distinguished both from the ontal world of permanent being and the ideal world of permanent truth. **c** An empirical as distinguished from a noumenal reality. This meaning is due to Kant's absolute separation of the thing-in-itself, or *noumenon*, from the object of experience, or *phenomenon*. It is more thoroughgoing than the ancient distinction, since Kant asserts the utter unknowability of the noumenon, while the ancients conceived essences to be knowable. **d** In positivistic and scientific usage, any fact or event of scientific interest susceptible of scientific description and explanation. Commonly, however, this use retains the implication of change or mode of being, that is, of an event rather than a thing, and particularly of an event which illustrates the operation of some general law. **e** In a secondary use in science (compare the popular use, def. 2), a rare fact or event, or one of especial or unique significance.

4. A person lacking liberal culture and refinement; one not appreciating the nobler aspirations and sentiments of humanity; a person, esp. of the middle class, who rejects enlightenment or is indifferent to the higher intellectual interests, preferring the material and commonplace; one whose scope is limited to selfish and material interests.

If we look into the thing closely, we shall find that the term *Philistine* conveys a sense which makes it more peculiarly appropriate to our middle class than our aristocratic. For *Philistine* gives the notion of something particularly stiff-necked and perverse in the resistance to light and its children; and therein it specially suits our middle class, who not only do not pursue sweetness and light, but who even prefer to them that sort of machinery of business, chapels, tea meetings, and addresses from Mr. Murphy, which makes up the dismal and illiberal life on which I have so often touched. . . . I often, therefore, when I want to distinguish clearly the aristocratic class from the *Philistines* proper, or middle class, name the former, in my own mind, the Barbarians. *M. Arnold.*

Similarly, metals are produced from their calces by the union of the latter with phlogiston. Soot was regarded as almost pure phlogiston, and sulphur as very rich in it. 2. An instrument for mechanically recording and reproducing human speech and other sounds. As invented by Edison in 1876, it consisted of a rotating brass cylinder covered with tin foil, against which pressed a steel point connected with a thin diaphragm. When the diaphragm was made to vibrate by sound, the steel, following a spiral groove cut on the cylinder, made a series of indentations on the tin foil, and when the steel was caused to retrace its path, vibrations were imparted to the diaphragm and the original sounds reproduced, though in diminished volume. The present perfected machine has the same principle, but for the tin foil has been substituted a cylinder of hard wax, for the steel point a bit of sapphire (sharp for recording, blunt for reproducing), etc. Steady rotation of the cylinder is maintained by a strong spring or an electric motor. There are other forms of the instrument, as the *graphophone*, using wax-coated pasteboard cylinders, and the *gramophone*, whose reproducing records are disks of hard rubber or composition prepared by special processes from the original record.

phosphoric acid, *Chem.*, any of three oxyacids of phosphorus known respectively as ordinary or orthophosphoric, pyrophosphoric, and metaphosphoric acids. **Orthophosphoric acid,** or simply **phosphoric acid,** H_3PO_4, is a siruplike or deliquescent crystalline substance obtained by the oxidation of phosphorus, by the decomposition of phosphates, etc. Being tribasic, it forms three classes of salts, NaH_2PO_4, Na_2HPO_4, and Na_3PO_4, known respectively as **primary, secondary,** and **tertiary, phosphates.** The first two are also called **acid phosphates** in distinction from the **neutral,** or **normal, phosphates** (the third class). Phosphoric acid in the form of phosphates, as those of calcium, is an important ingredient in fertilizers, but to be available for use by plants the phosphates must be soluble in water or plant juices. Insoluble neutral or basic phosphates hence require to be converted into soluble acid salts. **Reverted phosphoric acid** is that which after such conversion has returned to its former state. **Pyrophosphoric acid,** or **diphosphoric acid,** $H_4P_2O_7$ (tetrabasic), is derived from the ortho acid by the loss of one molecule of water from two of the acid; it is a glasslike or crystalline solid. **Metaphosphoric acid,** or **glacial phosphoric acid,** HPO_3 (monobasic), represents a still greater loss of water from the ortho acid. It is a glasslike solid obtained from the ortho acid by heating. — **p. anhydride** *or* **oxide.** = PHOSPHORUS PENTOXIDE.

3. *Chem.* A nonmetallic element of the nitrogen group, usually obtained as a white or yellowish, translucent, waxy crystalline substance with a disagreeable smell and a faint glow in moist air. Symbol, *P*; atomic weight, 31.04. Phosphorus does not occur free in nature, but in combined form, esp. in the phosphates, it is very common, being found in all fruitful soils and in most natural waters, and being essential to the life of plants and animals. Its most important minerals are phosphorite, apatite, wavellite, and vivianite. Chemically, phosphorus is chiefly trivalent (phosphorous compounds) and pentavalent (phosphoric compounds). The element exists in at least three allotropic modifications: (1) **Ordinary, white,** or **yellow, phosphorus,** described above. It is prepared from calcium phosphate (from bone ash or other source), either by decomposing this with sulphuric acid so as to form phosphoric acid, and heating the latter to redness with carbon in earthenware retorts, or by heating the phosphate directly with carbon and fluxes in an electric furnace. In either case the phosphorus is vaporized, condensed under water, purified, and cast into sticks. It is very active chemically and very poisonous. Sp. gr., 1.83. It inflames readily, forming, as it burns, white fumes of phosphorus pentoxide (hence it is kept under water). It is used in manufacturing matches and to a lesser extent in making phosphor bronze, dyes, and other organic compounds, rat poisons, etc. (2) **Red,** or so-called **amorphous, phosphorus,** obtained from ordinary phosphorus by heating it in a closed vessel at 300° C., and in other ways. It is a reddish brown compact solid or powder, tasteless, odorless, nonpoisonous when taken internally, and not burning till heated to 260° C. It is crystalline, at least partially. Sp. gr., 2.11. It is used with safety matches and in the laboratory. Red phosphorus can be obtained in dark, metallic-looking crystals (the so-called **metallic phosphorus**) by heating ordinary phosphorus to high temperatures in contact with lead. (3) **Scarlet phosphorus,** obtained as a fine precipitate by boiling a solution of ordinary phosphorus in phosphorus tribromide. It is amorphous and nonpoisonous, but chemically active, and is used in matches.

pho-tog'ra-phy (-fĭ), *n.* [*photo-* + *-graphy:* cf. F. *photographie.*] **1.** The art or process of producing images on sensitized surfaces by the chemical action of light (or, less strictly, of any form of radiant energy). Important points in the history of photography are: the early observation of the sensitiveness of certain salts to light, the production by Wedgwood and Davy of transient pictures on this principle (1802), the introduction of heliography (1814), of the daguerreotype (1839), the calotype (1841), the albumen process (1848), the collodion process (1851), and the gelatin process (1871). The modern dry plate is a glass plate (often replaced by a transparent flexible film) coated with an emulsion of silver salt, as the chloride, in gelatin. Exposure to light, as in the camera, causes a slight reduction of the silver salt, forming a latent image. The reduction is continued by the developer, and the image of finely divided silver becomes visible. The fixing agent removes any unchanged sensitive salt. From the negative thus obtained, in which the arrangement of light and shade is the reverse of that in the original, any number of positives may be printed on sensitized surfaces of paper, glass, etc. Various sensitizers may be used, as salts of silver, iron, and platinum. (See ARISTOTYPE, CYANOTYPE, PLATINOTYPE.) Some processes (developing) require a developer, others (printing out) do not. A toning solution, as of a gold salt, is used in some cases to better the shade of the positive image and increase its permanence. Recently a process of printing by catalysis has been worked out (see CATATYPE). See also CAMERA, 2, DEVELOPER **a**, etc. **2.** Extremely faithful, minutely detailed, or mechanically accurate reproduction or representation.

Rumford's photometer (fig. 1), a comparison is made of the shadows (*S* and *s*) cast by a rod on a ground-glass screen (*G*); with Bunsen's (fig. 2), the one commonly used, a movable piece of paper (*D*), placed between the two sources of light (*L* and *l*), is observed. On the paper is a grease spot which will appear darker than the rest of the paper when the reflected light is in excess, and lighter when the transmitted light is the greater. In the improved photometer of Lummer and Brodhun a combination of prisms replaces the greased paper. The *flicker photometer* is based on the principle that two lights of different intensities, alternated rather rapidly before the eye, produce a sensation of flickering, which disappears when the two lights are equally bright. It is esp. useful in comparing lights of different colors.

pho'to-syn'the-sis (-sĭn'thĕ-sĭs), *n.* *Plant Physiol.* The process of constructive metabolism by which carbohydrates are formed from water vapor and the carbon dioxide of the air in the chlorophyll-containing tissues of plants exposed to the action of light. It was formerly called *assimilation*, but this is now commonly used as in animal physiology. (See ASSIMILATION, 2.) The details of the process are not yet clearly known. Baeyer's theory is that the carbon dioxide is reduced to carbon monoxide, which, uniting with the hydrogen of the water in the cell, produces formaldehyde, the latter forming various sugars through polymerization. Vines suggests that the carbohydrates are secretion products of the chloroplasts, derived from the decomposition of previously formed proteids. The food substances are usually quickly translocated, those that accumulate being changed to starch, which appears in the cells almost simultaneously with the sugars. The chloroplasts perform photosynthesis only in light and within a certain range of temperature, varying according to climate. This is the only way in which a plant is able to organize carbohydrates. All plants without a chlorophyll apparatus, as the fungi, must be heterotrophic (parasitic or saprophytic). See CHLOROPHYLL, CHLOROPLAST, CARBOHYDRATE; cf. The position of leaves is generally governed chiefly by their relation to light. There are two main types of arrangement: the **alternate** or **spiral**, in which a single leaf is borne at a node, and the **verticillate** or **whorled**, in which two or more are borne at a node. When each whorl consists of a pair of leaves, the latter are called **opposite**, and are usually placed decussately (see DECUSSATE). In the alternate arrangement each leaf is inserted above the last at a definite distance around the circumference (see ANGLE OF DIVERGENCE). The spiral thus traced is the **genetic spiral**; the vertical lines on the stem joining the superposed leaves are the **orthostichies**. The phyllotaxis of a given plant is indicated by a fraction whose numerator expresses the number of turns in the genetic spiral ; the denominator, the number of orthostichies ; the whole fraction, the distance of one leaf from the next in terms of the circumference.

One form, including winged and wingless individuals, produces galls on the leaves and twigs, another, always wingless, affects the roots.

It is combated most effectively by grafting vines on certain American varieties of vines which are nearly immune to it.

PEEP to chirp, PIEROCH, PIGEON, FIFE.] **1.** A wind instrument, consisting of a tube or tubes of straw, reed, wood, or metal, as, for example, a flageolet or an oboe; any tube which produces musical sounds; as, a shepherd's *pipe*; "Tunable as sylvan *pipe*." *Milton.* "Now had he rather hear the tabor and the *pipe*." *Shak.* Specif., an organ pipe (see ORGAN, 1 **b**, FLUE PIPE, REED PIPE). An open pipe sounding the primary or fundamental note has a node in the middle and an antinode at each end; a closed, or stopped, pipe, a node at the stopped end and an antinode at the mouth. Thus an open pipe has its fundamental tone an octave higher than a closed pipe of the same effective length (see NODE, 7, and *Citation* below). The upper harmonics, as distinguished from the fundamental, or first harmonic, are produced by simply blowing the open pipe yielding the complete series, the closed pipe only the odd series. For these upper harmonics the number of loops and nodes is correspondingly greater. Thus, in an open pipe, the loops and nodes divide the column into 2, 4, 6, etc., parts for the first, second, third, etc., harmonics, respectively, starting with the fundamental (see HARMONIC, *n.*, 1). The note of a pipe depends on the ratio of the length to the cross-sectional area; the greater the ratio, the lower the tone.

Practically the open *pipe* is equivalent to one a little longer than its actual length, by about .85*δ* of the radius of the *pipe* for the open end, and .59 for the mouth. *Grove's Dict. of Music.*

12. *Acoustics & Music.* The acuteness or gravity of sound or of a tone, depending on the rate of the vibration producing it. Also, a particular standard of vibration frequency for tones, by which they may be compared, and instruments may be tuned; as, French *pitch*. A high pitch results from rapid, and a low one from slow, vibration. The **relative pitch** of a tone is determined by its position in a scale. Its **absolute pitch** is determined by computing the number of its vibrations per second, called its vibration number, and is given a letter name and represented by a particular staff degree. (See *Illust.*) Various standards of pitch have been in use. **Classical pitch**, used in the latter half of the 18th century, gave treble A (*a′*) a vibration number between 415 and 429. From about 1816 on, the desire of instrument makers to secure brilliancy led to a continual raising of the pitch, until it reached undesirable heights, as in the concert, or **high, pitch**, with *a′* at about 450, which is still the official standard of the British army bands, and is retained in some organs, chiefly English. Stuttgart, or Scheibler's, **pitch**, with *a′* at 440, was adopted by the Stuttgart Congress of Physicists in 1834. The diapason normal, called **French, international**, or **low, pitch**, established by the French government in 1859, and now prevailing throughout the musical world, gives *a′* at 435. **Philosophical pitch**, used for convenience in calculations, is a theoretical pitch giving middle C (*c′*) at 256 (with *a′*, 427), that being the power of 2 nearest the ordinary vibration number for *c′*. The absolute pitch of each note in the octave *c′* to *c″* of the major diatonic scale, both pure and tempered (see 6th SCALE, *n.*, 3 **a**), is:

	Pure	*Tempered*		*Pure*	*Tempered*
c′	261.000	258.632	*g′*	391.500	387.540
d′	293.625	290.327	*a′*	435.000	435.000
e′	326.250	325.881	*b′*	489.375	488.270
f′	348.000	345.259	*c″*	522.000	517.304

It is usually expelled after the young is born, constituting the chief part of the afterbirth. The placenta consists of a modified part of the chorion of the fetus, which develops villi that are received into the modified mucous membrane of the womb. There is no admixture of maternal and fetal blood, but an interchange of the dissolved substances by diffusion. The fetus is attached to the placenta by the umbilical cord. In the nondeciduate type of placenta the chorionic villi are simply received into depressions in the uterine portion and withdrawn at parturition. In the deciduate type, characteristic of the higher mammals, the relationship is so intimate that more or less of the uterine wall is torn off in parturition. (See DECIDUA.) When nearly the whole chorion is studded with villi and functions as a placenta, as in the perissodactyls, dogs, camels, cetaceans, etc., the placenta is called **diffuse**. When the villi occur in small isolated groups, as in ruminants, it is called **cotyledonary**. These two types are always nondeciduate. When they are arranged in a zone or band, as in carnivora, elephants, and some edentates, it is called **zonary**; when they are restricted to a disklike area, as in Insectivora, rodents, bats, it is called **discoidal**. Apes and man exhibit a form of discoidal placenta supposed to be a modification of the diffuse typ and called **metadiscoidal**.

plant (plănt; 277), *n.* [AS. *plante*, L. *planta* sprout, shoot, slip, cutting: cf. F. *plante.* In some senses fr. the v. Cf. PLANT, *v.*, PLANT sole of the foot.] **1.** A young tree, shrub, or herb, planted or ready to plant; a slip, cutting, or sapling; as, he has cabbage *plants* for sale. *Now Dial., Local, or Trade Term.* "A *plant* of stubborn oak." *Dryden.* **2.** The stem of a young tree used as a cudgel, pole, etc. *Obs.* **3.** Any member of the group of living organisms exhibiting irritability in response to stimuli, though generally without voluntary motion or true sense perception; a vegetable in the broad sense, as distinguished from an animal. Owing to the close relationship between the lower members of the animal and vegetable kingdoms, it is impossible to define *plant* in terms that will include all plants and exclude all animals (see ANIMAL, *n.*, 1). The majority of plants have *cells* commonly invested with a membrane or wall composed of cellulose; they obtain *food* chiefly in the form of salts in solution, and from the air in the form of carbon dioxide; and they form carbon compounds in the tissues by means of the green coloring matter chlorophyll (see CHLOROPHYLL, PHOTOSYNTHESIS). *Ontogenetic development* is practically continuous, at least at certain points, during the life of the organism. In *reproduction*, the alternation of generations is usually marked, the sexual giving rise to the asexual, and vice versa. But even these criteria are not conclusive, as the *fungi* and other *saprophytes* have no chlorophyll, and depend, like animals, on plants for their nourishment. Their cell walls do not contain true cellulose, which is also wanting in the bacteria. Many fungi, moreover, the sexual generation is altogether suppressed, while in some algæ it is the only phase of the life cycle.

The *plant body* (thallus) may consist of a single cell, a group of cells, or a tissue of increasing complexity and differentiation In the seed plants it exhibits three great structural systems (fundamental, tegumentary, and vascular), each adapted to some particular function.

Plants may be *classified* according to an artificial or a natural system; in the former, now obsolete, one or two characters form the basis of comparison; in the latter all known characters are taken into account in determining the genetic relationships (see CLASSIFICATION, 3). The most notable artificial system was that of Linnæus (1735), by which plants were divided into 24 *classes* according to the stamens. The first comprehensive natural system was that of A. L. de Jussieu (1789). Various other systems, as Lindley, Candolle, Endlicher, Bentham and Hooker, etc., were proposed during the 19th century; many of these included only the higher plants. The classification of Engler and Prantl is now very generally adopted. It takes account of all plants, recognizing *phyla* or *divisions* (Abteilungen), *classes* (Klassen), *orders* (Reihen), *families* (Familien), *genera*, and *species*. The following slightly modified arrangement of the phyla, observed in this Dictionary, is in common use among American botanists; some authors, however, unite the Myxophyta and Thallophyta, while others regard the slime molds as animals: Myxophyta (slime molds), Thallophyta (algæ, fungi, and bacteria), Bryophyta (mosses and liverworts), Pteridophyta (ferns and fern allies), Spermatophyta (seed plants).

4. a The machinery, apparatus, fixtures, etc., employed in carrying on a trade or a mechanical or other industrial business; as, an electric-light *plant*, a fishing *plant*, etc. In the commercial sense, a *plant* may include real estate and all else that represents capital invested in the means of carrying on a business, exclusive of the raw material or the manufactured product. **b** A workshop or other apparatus complete; as, a bicycle *plant.* **c** By extension, the equipment of any institution; as, the *plant* of a college.

5.
